1 引言

关于 Laplace-Stieltjes 变换所定义的函数增长性, 余家荣首先在文 [1] 中得到 Valiron-Knopp-Bohr 公式, 并利用该公式得到了有关“最大模”和“最大项”的相关估计. 在此基础上, 文献 [2-6] 通过定义 (R) 级以及引入型函数定义的精确级研究了在半平面上解析的 Laplace-Stieltjes 增长性, 文 [2] 还通过定义指教级研究了在半平面上解析的具有相同零级的 Laplace-Stieltjes 变换的增长性, 得到了一些较好的结果. 本文将通过引入对数级, 进一步精确地研究在右半平面上具有零级的 Laplace-Stieltjes 变换的增长性, 并得到关于这类变换的增长性的系数特征. 考虑 Laplace-Stieltjes 变换所定义的函数

$$F(s) = \int_0^{+\infty} e^{-sx} d\alpha(x) \quad (s = \sigma + it, \sigma, t \in \mathbb{R}), \quad (1)$$

$\alpha(x)$ 是对于 $x \geq 0$ 有定义的实数或复数值函数, 而且它在任何闭区间 $[0, X]$ ($0 < X < +\infty$) 上是圈变的.

作序列

$$0 = \lambda_0 < \lambda_1 < \lambda_2 < \dots < \lambda_n \uparrow +\infty, \quad (2)$$

并且满足

$$\overline{\lim}_{n \rightarrow \infty} \frac{n}{\lambda_n} = D < +\infty, \quad \overline{\lim}_{n \rightarrow \infty} (\lambda_{n+1} - \lambda_n) = h < +\infty. \quad (3)$$

令 $A_n^* = \sup_{\lambda_n < x \leq \lambda_{n+1}, t \in \mathbb{R}} \left| \int_{\lambda_n}^x e^{-ity} d\alpha(y) \right|$, 由文 [1] 知, 当序列 (2) 满足

$$\overline{\lim}_{n \rightarrow \infty} \frac{\log A_n^*}{\lambda_n} = 0 \quad (4)$$

时, 变换 (1) 的一致收敛横坐标为 $\sigma_u^F = 0$, 此时变换 (1) 定义的函数 $F(s)$ 为右半平面上的解析函数. 对 $\sigma > 0$ 时, 记

$$M_u(\sigma, F) = \sup_{0 < x < +\infty, t \in \mathbb{R}} \left| \int_0^x e^{-(\sigma+it)y} d\alpha(y) \right|, \mu(\sigma, F) = \max_{1 \leq n < +\infty} A_n^* e^{-\lambda_n \sigma},$$

$$N(\sigma) = \max\{n : \mu(\sigma, F) = A_n^* e^{-\lambda_n \sigma}\}.$$

定义 1.1 如果变换 (1) 满足 (2)–(4) 式, 定义变换 (1) 在右半平面的增长级为

$$\rho = \lim_{\sigma \rightarrow 0} \frac{\log^+ \log^+ M_u(\sigma, F)}{-\log \sigma},$$

当 $\rho = 0$ 时, 称 $F(s)$ 是右半平面上的零级 L-S 变换.

定义 1.2 设 $F(s)$ 是右半平面上的零级 L-S 变换, 且存在 $\varepsilon > 0$, 使得

$$\frac{\mu(\sigma, F)}{\sigma^{-\varepsilon}} \rightarrow \infty (\sigma \rightarrow 0), \quad (5)$$

定义 $F(s)$ 的对数级 ρ^* 和下对数级 λ^* 为

$$\rho^* = \varlimsup_{\sigma \rightarrow 0+} \frac{\log^+ \log^+ M_u(\sigma, F)}{\log \log \frac{1}{\sigma}}, \lambda^* = \varliminf_{\sigma \rightarrow 0+} \frac{\log^+ \log^+ M_u(\sigma, F)}{\log \log \frac{1}{\sigma}}.$$

2 引理及证明

引理 2.1 [2] 设变换 (1) 满足 (2)–(4) 式, 则对任意给定 $\varepsilon \in (0, 1)$ 和充分接近 0 的 $\sigma (\sigma > 0)$, 有

$$\frac{1}{3} \mu(\sigma, F) \leq M_u(\sigma, F) \leq K(\varepsilon) \mu((1 - \varepsilon)\sigma, F) \frac{1}{\sigma},$$

其中 $K(\varepsilon)$ 是只与 ε 有关的常数.

注 1 由引理 2.1 及条件 (5), 我们可以得到 $1 \leq \lambda^*, \rho^* \leq +\infty$.

引理 2.2 [2] 设变换 (1) 满足 (2)–(4) 式, 则存在 $\delta > 0$, 当 $0 < \sigma < \delta$ 时,

$$\log \mu(\sigma, F) = A - \int_\delta^\sigma \lambda_{n(x)} dx,$$

其中 A 为常数.

由文 [7] 中定理 3.2 的证明, 有

引理 2.3 关于 x 的函数 $g(x) = (\log x)^T + rx$ 的最大值为 $[\log \frac{T}{r}]^T - T$, 其中 $r < 0, x \geq 0$.

3 定理及证明

定理 3.1 设变换 (1) 满足 (2)–(5) 式, 且有对数级 ρ^* , 则 $\max\{1, \varlimsup_{n \rightarrow +\infty} \frac{\log^+ \log^+ A_n^*}{\log \log \lambda_n}\} = \rho^*$.

证 设 $\max\{1, \varlimsup_{n \rightarrow +\infty} \frac{\log^+ \log^+ A_n^*}{\log \log \lambda_n}\} = u$, 则 $1 \leq u \leq \infty$.

先证明 $u \leq \rho^*$, 不妨假设 $\rho^* < +\infty$, 则 $\forall \varepsilon > 0$, $\exists \sigma_0 = \sigma_0(\varepsilon) > 0$, 当 $0 < \sigma < \sigma_0$ 时,

$$\log M_u(\sigma, F) < (\log \frac{1}{\sigma})^{\rho^* + \varepsilon}.$$

由引理 2.1, 则有 $\log \mu(\sigma, F) < \log 3 + (\log \frac{1}{\sigma})^{\rho^* + \varepsilon}$, 所以 $\log A_n^* < \log 3 + (\log \frac{1}{\sigma})^{\rho^* + \varepsilon} + \lambda_n \sigma$. 取 n 使得 $\frac{1}{\sigma} = \frac{\lambda_n}{\rho^* + \varepsilon}$, 则

$$\log \log A_n^* < O(1) + (\rho^* + \varepsilon) \log \log \left(\frac{\lambda_n}{\rho^* + \varepsilon} \right) + \rho^* + \varepsilon.$$

所以由 ε 的任意性, 则有 $\overline{\lim_{n \rightarrow \infty}} \frac{\log^+ \log^+ A_n^*}{\log \log \lambda_n} \leq \rho^*$. 而当 $\rho^* = +\infty$ 时上式显然成立, 故 $u \leq \rho^*$.

下证 $u \geq \rho^*$, 不妨假设 $u < +\infty$, 则对 $\forall \varepsilon > 0$, $\exists n_0 = n_0(\varepsilon) > 0$, 当 $n > n_0$ 时,

$$\log A_n^* < (\log \lambda_n)^{u+\varepsilon}. \quad (6)$$

另一方面,

$$\int_0^x e^{-(\sigma+it)y} d\alpha(y) = \sum_{k=1}^{n-1} \int_{\lambda_k}^{\lambda_{k+1}} e^{-(\sigma+it)y} d\alpha(y) + \int_{\lambda_n}^x e^{-(\sigma+it)y} d\alpha(y) \quad (\lambda_n < x \leq \lambda_{n+1}),$$

令

$$I_k(x, it) = \int_{\lambda_k}^x e^{-ity} d\alpha(y) \quad (\lambda_n < x \leq \lambda_{n+1}),$$

则当 $\lambda_k \leq x \leq \lambda_{k+1}$, $-\infty < t < +\infty$ 时

$$|I_k(x, it)| \leq A_k^* \leq \mu(\sigma, F) e^{\lambda_k \sigma}.$$

又由于

$$\begin{aligned} \int_{\lambda_k}^{\lambda_{k+1}} e^{-\sigma y} d_y I_k(y, it) &= [e^{-\sigma y} I_k(y, it)] \Big|_{\lambda_k}^{\lambda_{k+1}} - \int_{\lambda_k}^{\lambda_{k+1}} I_k(y, it) d\alpha(y) \\ &= e^{-\sigma \lambda_{k+1}} I_k(\lambda_{k+1}, it) - e^{-\sigma \lambda_k} I_k(\lambda_k, it) + \sigma \int_{\lambda_k}^{\lambda_{k+1}} I_k(y, it) e^{-\sigma y} dy \\ &= e^{-\sigma \lambda_{k+1}} I_k(\lambda_{k+1}, it) + \sigma \int_{\lambda_k}^{\lambda_{k+1}} I_k(y, it) e^{-\sigma y} dy, \end{aligned}$$

同理有

$$\int_{\lambda_n}^x e^{-\sigma y} d_y I_n(y, it) = e^{-\sigma x} I_n(x, it) + \sigma \int_{\lambda_n}^x I_n(y, it) e^{-\sigma y} dy.$$

于是当 $\lambda_n \leq x \leq \lambda_{n+1}$, $\sigma > 0$ 时

$$\begin{aligned} \int_0^x e^{-(\sigma+it)y} d\alpha(y) &= \sum_{k=1}^{n-1} \int_{\lambda_k}^{\lambda_{k+1}} e^{-\sigma y} d_y I_k(y, it) + \int_{\lambda_n}^x e^{-\sigma y} d_y I_n(y, it) \\ &= \sum_{k=1}^{n-1} [e^{-\lambda_{k+1}\sigma} I_k(\lambda_{k+1}, it) + \sigma \int_{\lambda_k}^{\lambda_{k+1}} e^{-\sigma y} I_k(y, it) dy] \\ &\quad + e^{-x\sigma} I_n(x, it) + \sigma \int_{\lambda_n}^x e^{-\sigma y} I_n(y, it) dy, \end{aligned}$$

从而

$$\begin{aligned}
\left| \int_0^x e^{-(\sigma+it)y} d\alpha(y) \right| &\leq \sum_{k=1}^{n-1} [e^{-\lambda_{k+1}\sigma} |I_k(\lambda_{k+1}, it)| + \sigma \int_{\lambda_k}^{\lambda_{k+1}} e^{-\sigma y} |I_k(y, it)| dy] \\
&\quad + e^{-x\sigma} |I_n(x, it)| + \sigma \int_{\lambda_n}^x e^{-\sigma y} |I_n(y, it)| dy \\
&\leq \sum_{k=1}^{n-1} [A_k^* e^{-\lambda_{k+1}\sigma} + A_k^*(e^{-\sigma\lambda_k} - e^{-\sigma\lambda_{k+1}})] + A_n^* e^{-\sigma\lambda_n} \\
&\leq \sum_{n=1}^{\infty} A_n^* e^{-\lambda_n\sigma}.
\end{aligned}$$

所以由(6)式

$$M_u(\sigma, F) \leq \sum_{n=1}^{n_0} A_n^* e^{-\lambda_n\sigma} + \sum_{n=n_0+1}^{+\infty} A_n^* e^{-\lambda_n\sigma} \leq P(n_0) + \sum_{n=n_0+1}^{\infty} \exp\{(\log \lambda_n)^{u+\varepsilon} - \lambda_n\sigma\}, \quad (7)$$

其中 $P(n_0)$ 是与 n_0 有关的常数. 取 N 满足 $N = (D + \varepsilon)\frac{2}{\sigma}(\log \frac{2}{\sigma})^{u+\varepsilon}$, 由(7)式和引理 2.3 有

$$\begin{aligned}
M_u(\sigma, F) &\leq P(n_0) + \sum_{n=n_0+1}^N \exp\{(\log \lambda_n)^{u+\varepsilon} - \lambda_n\sigma\} + \sum_{n=N+1}^{\infty} \exp\{(\log \lambda_n)^{u+\varepsilon} - \lambda_n\sigma\} \\
&\leq P(n_0) + N \left(\exp\left\{ \left(\log \frac{u+\varepsilon}{\sigma} \right)^{u+\varepsilon} - (u+\varepsilon) \right\} \right) + \sum_{n=N+1}^{\infty} \exp\{(\log \lambda_n)^{u+\varepsilon} - \lambda_n\sigma\}.
\end{aligned}$$

对于每个 $\sigma > 0$, 定义函数 $n(\sigma)$ 满足 $\lambda_{n(\sigma)} < \frac{2}{\sigma} < \lambda_{n(\sigma)+1}$, 则对充分接近 0 的 $\sigma (\sigma > 0)$, 由(3)式中第一个等式, 当 $n > N$ 时,

$$\lambda_n > \frac{n}{D + \varepsilon} > \frac{N}{D + \varepsilon} = \frac{2}{\sigma} \left(\log \frac{2}{\sigma} \right)^{u+\varepsilon} > \frac{2}{\sigma} (\log \lambda_n)^{u+\varepsilon}.$$

所以

$$\begin{aligned}
\sum_{n=N+1}^{\infty} \exp\{(\log \lambda_n)^{u+\varepsilon} - \lambda_n\sigma\} &\leq \sum_{n=N+1}^{\infty} \exp\left\{-\frac{\lambda_n\sigma}{2}\right\} \\
&\leq \sum_{n=N+1}^{\infty} \exp\left\{-\frac{n\sigma}{2(D + \varepsilon)}\right\} = \frac{\exp\left\{-\frac{\sigma(N+1)}{2(D + \varepsilon)}\right\}}{1 - \exp\left\{\frac{-\sigma}{2(D + \varepsilon)}\right\}} \leq \frac{\exp\left\{\frac{-\sigma N}{2(D + \varepsilon)}\right\}}{1 - \exp\left\{\frac{-\sigma}{2(D + \varepsilon)}\right\}}.
\end{aligned}$$

由于

$$\lim_{\sigma \rightarrow 0} \frac{\exp\left\{\frac{-\sigma N}{2(D + \varepsilon)}\right\}}{1 - \exp\left\{\frac{-\sigma}{2(D + \varepsilon)}\right\}} = \lim_{\sigma \rightarrow 0} \frac{\exp\left\{-\left(\log \frac{2}{\sigma}\right)^{u+\varepsilon}\right\}}{\frac{\sigma}{2(D + \varepsilon)}(1 + o(\sigma))} = 0,$$

所以

$$\sum_{n=N+1}^{\infty} \exp\{(\log \lambda_n)^{u+\varepsilon} - \lambda_n\sigma\} = o(1) \quad (\sigma \rightarrow 0).$$

所以对充分接近 0 的 $\sigma (\sigma > 0)$,

$$M_u(\sigma, F) \leq P(n_0) + N\left(\exp\left\{\left(\log \frac{u+\varepsilon}{\sigma}\right)^{u+\varepsilon} - (u+\varepsilon)\right\}\right) + o(1),$$

则

$$\log \log M_u(\sigma, F) \leq (1 - o(1))(u + \varepsilon) \log \log \frac{u + \varepsilon}{\sigma} + o(1),$$

由 ε 的任意性, 有

$$\overline{\lim}_{\sigma \rightarrow 0} \frac{\log \log M_u(\sigma, F)}{\log \log \frac{1}{\sigma}} \leq u.$$

由于 $u = +\infty$ 时上式是显然成立的, 所以 $\rho^* \leq u$.

定理 3.2 设变换 (1) 满足 (2)–(5) 式, 且有对数级 ρ^* , 则

$$\overline{\lim}_{\sigma \rightarrow 0} \frac{\log^+ \log^+ \mu(\sigma, F)}{\log \log \frac{1}{\sigma}} = \overline{\lim}_{\sigma \rightarrow 0} \frac{\log^+ \log^+ M_u(\sigma, F)}{\log \log \frac{1}{\sigma}} = \rho^*.$$

证 作 Dirichlet 级数

$$f(s) = \sum_{n=1}^{+\infty} A_n^* e^{-\lambda_n s}, \quad (8)$$

则级数 (8) 所确定的函数是右半平面上的解析函数, 由文 [8] 中定理 1.1 和定理 1.2 有

$$\max\left\{1, \overline{\lim}_{\sigma \rightarrow 0} \frac{\log^+ \log^+ A_n^*}{\log \log \lambda_n}\right\} = \overline{\lim}_{\sigma \rightarrow 0} \frac{\log^+ \log^+ \mu(\sigma, F)}{\log \log \frac{1}{\sigma}},$$

再由定理 3.1, 可知定理成立.

定理 3.3 设变换 (1) 满足 (2)–(5) 式, 且有对数级 $\rho^* (1 < \rho^* < +\infty)$, 则

$$\rho^* - 1 \leq \overline{\lim}_{\sigma \rightarrow 0} \frac{\log(\lambda_{N(\sigma)} \sigma)}{\log \log \frac{1}{\sigma}} \leq \rho^*.$$

证 设 $\overline{\lim}_{\sigma \rightarrow 0} \frac{\log(\lambda_{N(\sigma)} \sigma)}{\log \log \frac{1}{\sigma}} = \theta$, 则 $\forall \varepsilon > 0, \exists \sigma_1 = \sigma_1(\varepsilon) > 0$, 当 $0 < \sigma < \sigma_1$ 时,

$$\lambda_{N(\sigma)} \sigma < \left(\log \frac{1}{\sigma}\right)^{\theta+\varepsilon}, \quad (9)$$

由引理 2.2,

$$\log \mu(\sigma, F) = A - \int_{\sigma_0}^{\sigma} \lambda_{N(x)} dx.$$

令 $\sigma_0 = \min\{\delta, \sigma_1\}$, 则当 $0 < \sigma < \sigma_0$ 时, 由 (9) 式有

$$\begin{aligned} \log \mu(\sigma, F) &< A - \int_{\sigma_0}^{\sigma} \frac{\left(\log \frac{1}{x}\right)^{\theta+\varepsilon}}{x} dx \\ &\leq A + \frac{1}{\theta + \varepsilon + 1} \left[\left(\log \frac{1}{\sigma}\right)^{\theta+\varepsilon+1} - \left(\log \frac{1}{\sigma_0}\right)^{\theta+\varepsilon+1} \right] \\ &\leq \frac{1}{\theta + \varepsilon + 1} \left(\log \frac{1}{\sigma}\right)^{\theta+\varepsilon+1} + O(1). \end{aligned}$$

由 ε 的任意性, 有

$$\varlimsup_{\sigma \rightarrow 0} \frac{\log^+ \log^+ \mu(\sigma, F)}{\log \log \frac{1}{\sigma}} \leq \theta + 1,$$

再由定理 3.2, 则有 $\rho^* \leq \theta + 1$.

另一方面, 由 $\rho^* = \varliminf_{\sigma \rightarrow 0} \frac{\log^+ \log^+ M_u(\sigma, F)}{\log \log \frac{1}{\sigma}}$, 则 $\forall \varepsilon > 0, \exists \sigma_1 = \sigma_1(\varepsilon) > 0$, 当 $0 < \sigma < \sigma_1$ 时,

$$\log M_u(\sigma, F) < (\log \frac{1}{\sigma})^{\rho^* + \varepsilon}.$$

由引理 1.1, 则有

$$\log \mu(\sigma, F) < \log 3 + (\log \frac{1}{\sigma})^{\rho^* + \varepsilon}, \quad (10)$$

由(3)式, 对上述的 ε 和 σ 有

$$\sigma N(\sigma) < (D + \varepsilon) \lambda_{N(\sigma)} \sigma \leq -2(D + \varepsilon) \int_{\sigma}^{\frac{\sigma}{2}} \lambda_{N(x)} dx \leq 2(D + \varepsilon) \log \mu(\sigma, F) + O(1).$$

再由(10)式, 则有

$$\sigma N(\sigma) \leq 2(D + \varepsilon) (\log \frac{1}{\sigma})^{\rho^* + \varepsilon} + O(1),$$

两边取对数再除以 $\log \log \frac{1}{\sigma}$, 然后取上极限, 则有

$$\varlimsup_{\sigma \rightarrow 0} \frac{\log(\lambda_{N(\sigma)} \sigma)}{\log \log \frac{1}{\sigma}} \leq \rho^* + \varepsilon,$$

由 ε 的任意性, 有

$$\varlimsup_{\sigma \rightarrow 0} \frac{\log(\lambda_{N(\sigma)} \sigma)}{\log \log \frac{1}{\sigma}} \leq \rho^*.$$

综合前半部分证明, 可知定理成立.

注 2 若 $\varlimsup_{\sigma \rightarrow 0} \frac{\log(\lambda_{N(\sigma)} \sigma)}{\log \log \frac{1}{\sigma}} = 0$, 由定理 3.2 和注 1 可知此时 $\rho^* = 1$.

定理 3.4 设变换(1)满足(2)–(5)式, 且有下对数级 $\lambda^*(1 \leq \lambda^* \leq \infty)$, $\{n_k\}_1^\infty$ 是一列递增正整数序列, 则

$$\varlimsup_{k \rightarrow \infty} \frac{\log^+ \log^+ A_{n_k}^*}{\log \log \lambda_{n_{k+1}}} \leq \lambda^*.$$

证 设 $\varliminf_{k \rightarrow \infty} \frac{\log^+ \log^+ A_{n_k}^*}{\log \log \lambda_{n_{k+1}}} = \theta (0 \leq \theta < \infty)$, 则对任意给定的 $\varepsilon > 0$, 存在 $N > 0$, 当 $k > N$ 时,

$$\log^+ A_{n_k}^* \geq (\log \lambda_{n_{k+1}})^{\theta - \varepsilon}.$$

选取 $\sigma_k = \frac{\theta - \varepsilon}{\lambda_{n_k}}, k = 1, 2, \dots$, 当 $k > N$ 且 $\sigma_{k+1} \leq \sigma \leq \sigma_k$ 时,

$$\begin{aligned} \log^+ M_u(\sigma, F) &\geq \log^+ \mu(\sigma, F) \geq (\log \lambda_{n_{k+1}})^{\theta - \varepsilon} - \lambda_{n_k} \sigma \\ &\geq (\log \frac{1}{\sigma_{k+1}})^{\theta - \varepsilon} + O(1) \geq (\log \frac{1}{\sigma})^{\theta - \varepsilon} + O(1), \end{aligned}$$

所以

$$\lambda^* = \varlimsup_{\sigma \rightarrow 0+} \frac{\log^+ \log^+ M_u(\sigma, F)}{\log \log \frac{1}{\sigma}} \geq \theta.$$

若 $\theta = \infty$, 显然 $\lambda^* = \infty$, 所以定理得证.

Abstract: In this paper, the growth of the Laplace-Stieltjes transforms of zero order convergent in right half-plane is investigated. By using the definition of logarithmic order and lower logarithmic order, the relations between logarithmic order and lower logarithmic order and “coefficients” of the transformations is obtained. Some results of Dirichlet series are improved.

Keywords: Laplace-Stieltjes transform; growth; zero order; logarithmic order
